Advanced Manufacturing Technology (AMT) is a discontinued software package designed by Autodesk for the analysis and optimization of manufacturing plants, along with the optimization of companies' product and service delivery systems. AutoCAD is often compared with the competing software program SolidWorks. SolidWorks is a 3D CAD program specifically designed for 3D modeling. History and overview Since its first release, AutoCAD has been subject to frequent revisions and updates. 1982-1989 AutoCAD 1.0 was released in December 1982 as a desktop app for the Apple II computer. At that time, it was the first commercially available CAD software and competed with established CAD programs such as Drafting Plus and QuickCAD. The software was targeted at architects and contractors. AutoCAD 2.0 was released in July 1983 and was much more user-friendly than its predecessor, adding many new features and functions. AutoCAD 2.0 supported both line art and block art. The program remained a desktop app until version 3.0 was released in July 1986. AutoCAD 2.0 was bundled with the new Apple Macintosh platform (though it could be run on the Apple II) and introduced many new features, including multi-user networking capabilities and color printing. In January 1986, AutoCAD 3.0 was released. This version was a major step forward, introducing the new AutoCAD GUI (graphical user interface), which was the first CAD program to use the native interface of the Macintosh platform. This software also marked the first introduction of the object and feature-based architecture and greatly expanded the feature set. AutoCAD 3.0 was also the first CAD program to include multi-engine support (AutoCAD 3.0 supported four application engines: Apple II, Apple Macintosh, IBM PC, and Atari ST). The developers aimed to incorporate the new GUI's into the Windows version, but at the time of release, they were only available for the Macintosh. AutoCAD 3.0 also introduced integration with Microsoft Office. With this, AutoCAD 3.0 was able to import and edit text files and Microsoft Works spreadsheets. AutoCAD 3.0 also featured new drawing commands and revisions to the software, such as non-harsh fonts and newly-added support for drawing text in block or graphic mode, and export to a variety of

formats. AutoCAD 3.0 also supported several new drawing tools, such as the ability to place objects

Automatic digitizing technology Since 2011, Autodesk has begun to offer new capabilities for automatic digitizing by introducing and expanding its AutoCAD for Building Design Suite (BDS) architecture. Autodesk AutoCAD's BDS is a collection of products for architecture, engineering, construction and beyond that include: Autodesk Building Designer Autodesk Architecture Autodesk Architectural Modeling Autodesk Civil 3D Autodesk MEP Autodesk Structural Analyser Autodesk Site Preparation Autodesk Tree Designer Autodesk Revit Autodesk Revit Architecture Autodesk Topo Designer Autodesk Vectorworks AutoCAD has a built-in automatic digitizing technology with tools to create parametric and non-parametric surfaces that can be placed on drawings and models. When designing parametric or non-parametric surfaces, AutoCAD automatically creates lines, splines, circular arcs, circular segments, ellipses, rectangles, non-uniform parametric curves (NURBS), and 3D models for those surfaces. In addition, AutoCAD has the capability to create surfaces using the Simultaneous surface-and-volume modeling method. For more information on the different digitizing tools available in AutoCAD, please see the Autodesk Autodesk Knowledge Base. Tagging AutoCAD provides a solution to the tagging problem by allowing users to create sets of taggable items and to manipulate those tag sets. A tag set contains all the objects tagged with a tag, all the parameters associated with those objects, and the tag options. Tags can be shared among tag sets, and tag sets are automatically synchronized between drawings. Tags are also stored in a database in the form of a tag manager, which provides the tagging infrastructure to manage the tag sets. Tag Sets are always synchronized between drawings and do not need to be saved manually. Before releasing a drawing to users, the original tag set is exported to a set of XML files called Tag Manager XML, which also provides tools for managing tag sets and their synchronization. Before tagging any drawings with tags, a tag manager can be run to generate a list of tag set options, so that users can set the options easily. Tags are then applied to objects and parameters and the tag options are applied to each tag. The tag set is used to perform one of the following functions: Tag management Parametric surface creation ca3bfb1094

Q: Copy column contents to clipboard with SheetJS I'm working on a web application using SheetJS that includes an autocomplete feature. If I'm editing a cell and have a list of matches to the user's selection, I want to copy the entire contents of the column to the clipboard. The feature works using `Sheet.getRange({row: lastRow, column: colNum})` So I figured I could get the contents of the first cell in the column using the same method, but I'm not sure how to get the contents of the entire column. I could use javascript or jQuery to find the contents of the first cell and then copy it, but I'm wondering if SheetJS has a native method for doing this? I could also open the HTML, find the HTML of the cell and then copy that, but I'd prefer not to do this if there's an easier way.

A: So, using sheetJS you could do the following: `// define range of cells that will be used for autocomplete var r = sheet.getRange(2,1); // set the range for the autocomplete query sheet.setQuery(r);` To then copy the content to the clipboard, you could use the following code, which is just an example, you can change it to fit your needs: `var range = sheet.getRange('a1:a1'); range.copy('clipboard');`
