's Box I designed and created the box back in 1996 before the internet. People bought it, sent it on, then came back with their own variations and improvements that was built right into the new versions of the box. Various versions were also used at my companies, we called it Lames Outbox. I designed this version and made it just for fun to see what would happen when I made it available for the world to come see. People have been using it for 13 years with no extra charge! It's free in every respect. So for 13 years now I've been featuring on the World Wide Web the most modified version of the Box which I call the Kain Brothers Box. About 7 years ago I stopped including a tagline and it works well for me. It allows me to put away all my other projects and focus on this. I feel it's the best way for me to market it as a business to the world. If you're curious how to make a modified version of it yourself, here's how. I've also updated the box to Google Chrome & Firefox. There are nine simple steps to meditative eye-focusing exercises that can help prevent a slew of vision-destroying diseases, from macular degeneration to detachment of the retina. There's no contraption, no hassle, and it's free. It's a bit of a puzzle box. Step Direct your gaze at the large, bold, colorful, dual-image box you see in front of you. Step Try to see how the glossy-looking brown fuzzy shapes to the left and right of the box represent your field of view. Step Perhaps even more interesting is the big white shape in the middle of the box and below the gray-colored donut shape. It's somewhat similar

to the illuminated field of view of a computer monitor. Step Step Set yourself up at home or at a work cubicle using a color-balanced work surface and good lighting. Prevent computer burnout by resting your eyes and your hands. Since mind and arms both help balance

Field of the Invention The invention relates to circuitry for implementing a digital filter in a high performance mixed signal integrated circuit, and more particularly to dynamic pole-zero balancing in such circuitry. 2. Description of the Prior Art As the use of digital signal processing in high performance mixed signal integrated circuits has increased, the integration of large numbers of multipliers has become feasible in order to improve the performance of the digital filter. Typically, these multipliers are cascaded to obtain larger and larger sums and products in a single integrated circuit. A problem that arises is the dynamic imbalance between poles and zeros, i.e., the number of poles and zeros, respectively, in the transfer characteristic of the digital filter, due to the various gain stages and delay stages in the multiplier circuitry. Prior art circuits have provided for pole-zero balancing by providing a gain resistor in the poles and zeros of the digital filter. The resistor improves the balance, but has the disadvantage of additional power and delay. A resistor is used in all stages of the poles and zeros. Thus, a resistor in one stage of a pole-zero pair adds to the amount of power used in that particular stage, and consumes a significant amount of delay. Additionally, the resistor is in effect a gain element in the filter response. Also, the resistor can cause "shunting" effects in the filter circuit. For example, if an input signal is higher than the variable gain amplifier's $+/-30$ dB limit and is saturated, the circuit's gain can be varied in order to restore the signal to a value not greater than the $+/-30$ dB limit. However, if a variable resistor is placed within the filter's poles, the dynamic response of the poles can vary. The effect is to decrease the amount of pole attenuation with respect to the attenuation of the zeros, thus producing a softening of the digital filter's response. Thus, a need exists for circuitry that provides pole-zero balancing in a digital filter without the disadvantages described above.Outcomes of kinematic analysis in total hip arthroplasty.
