Elastic-tensor approaches to understanding the displacive order/disorder behavior of oxide perovskites, lithium-ion batteries, and superconductors. Perovskites and lithium-ion batteries are prototypical materials that exhibit displacive order/disorder behavior. We introduce the two-state quadrupolar glass (TSQG) model as a framework for understanding this behavior. At high doping, the system becomes insulating. Doping results in (a) an increase in the size of the sites at which the pair interactions are large, (b) a decrease in the number of pairs, (c) a decrease in the size of the grains of the system, and (d) an increase in the entropy that can be stored in the system. We find that it is convenient to think of the glass as being comprised of two different states, A and B, of which there are a number of possibilities for the A states, but a single state for the B states. The A and B states can be considered as dual descriptions of the glass, with the A states being high-energy and the B states being low-energy. We discuss several examples of perovskites, where the understanding of the displacive order/disorder behavior is particularly simple. We also discuss several classes of materials that show displacive behavior where the microscopic nature of the disorder is less clear but are expected to behave similarly to the materials listed above. We show how the TSQG model can be applied to superconductors. The Bells of St Bride The Bells of St Bride is a Christian rock, pop music and Christian praise and worship band. Based in the United Kingdom, they have four albums on the
